

**Listing of Claims:**

What is claimed is:

1. (currently amended): A method in a data processing system having a plurality of elements, each element having corresponding code and a graphical representation, the method comprising the steps of:

displaying [[a]] the graphical representation of the corresponding code of each of the plurality of elements including a first element and second element;  
receiving a request to form a link;  
receiving an indication of a first of the plurality of elements;  
receiving an indication of a second of the plurality of elements; and  
in response to receiving the request, the indication of the first element, and the  
indication of the second element,  
generating new code independent of the graphical representation and  
adding the new code to the first element to reflect the link to the  
second element and  
modifying the graphical representation of the code associated with  
the first element to reflect the link to the second element.

2. (cancelled).

3. (cancelled).

4. (original): The method of claim 1, wherein the step of adding new code to the first element comprises the steps of:

determining whether linking the first element to the second element would violate a predefined rule; and

when it is determined that linking the first element to the second element would not violate a predefined rule,

adding the new code to the first element to form the link to the second element.

5. (original): The method of claim 4, wherein the step of determining whether linking the first element to the second element would violate a predefined rule comprises the steps of:

determining whether the first element is a class and whether the second element is another class; and

when it is determined that the first element is the class and that the second element is the other class,

identifying the link from the first element to the second element as an inheritance link.

6. (original): The method of claim 5, further comprising the step of identifying a link error when it is determined that the first element is the class and that the second element is not the other class.

7. (original): The method of claim 4, wherein the step of determining whether linking the first element to the second element would violate a predefined rule comprises the steps of:

determining whether the first element is a class and whether the second element is an interface; and

when it is determined that the first element is the class and that the second element is the interface,

identifying the link from the first element to the second element as an implementation link.

8. (original): The method of claim 7, further comprising the step of identifying a link error when it is determined that the first element is the class and that the second element is not the interface.

9. (original): The method of claim 4, wherein the step of determining whether linking the first element to the second element would violate a predefined rule comprises the steps of:

determining whether the first element is an interface and the second element is another interface; and

when it is determined that the first element is the interface and the second element is the other interface,

identifying the link from the first element to the second element as an inheritance link.

10. (original): The method of claim 9, further comprising the step of identifying a link error when it is determined that the first element is the interface and the second element is not the other interface.

11 -19. (cancelled).

20. (currently amended): A method in a data processing system having a plurality of elements and having a link between two of the plurality of elements, wherein each element has corresponding code along with a graphical representation and the linked elements include a source and a destination, the method comprising the steps of:

displaying [[a]] the graphical representation of the corresponding code of each of the plurality of elements including the source and the destination;  
receiving an identification of the link;  
receiving a selection of one of the linked elements;  
receiving an identification of another of the plurality of elements that is different than the linked elements, wherein a graphical representation of the corresponding code of the other element is displayed;  
determining whether the selected element is the destination; and  
when it is determined that the selected element is the destination,  
modifying the corresponding code of the other element independently of the graphical representation in order to reflect a new  
link between the other element and the destination element and  
;

modifying the graphical representation of the corresponding code of the other element to reflect the new link between the other element and the destination element.

21. (original): The method of claim 20, wherein the modifying step further includes the step of modifying the corresponding code of the source to reflect the removal of the link between the source and the destination.

22. (cancelled).

23. (original): The method of claim 184, further comprising the step of modifying the graphical representation of the corresponding code of the source to reflect the removal of the link between the source and the destination.

24-25. (cancelled).

26. (original): The method of claim 20, wherein the modifying step includes the steps of: determining whether linking the other element to the destination would violate a predefined rule; and  
when it is determined that linking the other element to the destination would not violate a predefined rule,  
modifying the corresponding code of the source to reflect the removal of

the link between the source and the destination; and  
adding new code to the corresponding code of the other element to reflect  
the new link between the other element and the destination  
element.

27. (original): The method of claim 26, wherein the step of determining whether linking the other element to the destination would violate a predefined rule, comprises the steps of:

determining whether the other element is a class and whether the destination is another class; and  
when it is determined that the other element is the class and that the destination is the other class,  
identifying the new link between the other element and the destination as an inheritance link.

28. (original): The method of claim 26, wherein the step of determining whether linking the other element to the destination would violate a predefined rule, comprises the steps of:

determining whether the other element is a class and whether the destination is an interface; and  
when it is determined that the other element is the class and that the destination is the interface,  
identifying the new link between the other element and the destination as

an implementation link.

29. (original): The method of claim 28, further comprising the step of identifying a link error when it is determined that the other element is the class and that the destination is not the interface.

30. (original): The method of claim 26, wherein the step of determining whether linking the other element to the destination would violate a predefined rule, comprises the steps of:

determining whether the other element is an interface and the destination is another interface; and

when it is determined that the other element is the interface and the destination is the other interface,

identifying the new link between the other element and the destination as an inheritance link.

31. (original): The method of claim 30, further comprising the step of identifying a link error when it is determined that the other element is not the interface.

32. (original): The method of claim 30, further comprising the step of identifying a link error when it is determined that the destination is not the other interface.

33- 41. (cancelled).

42. (currently amended): A method in a data processing system having a plurality of elements and having a link between two of the plurality of elements, wherein each element has corresponding code along with a graphical representation and the linked elements include a source and a destination, the method comprising the steps of:

displaying [[a]] the graphical representation of the corresponding code of each of  
the plurality of elements including the source and destination;

receiving an identification of the link;

receiving a selection of one of the linked elements;

receiving an identification of another of the plurality of elements that is different  
than the linked elements, wherein a graphical representation of the  
corresponding code of the other element is displayed;

determining whether the selected element is the source; and  
when it is determined that the selected element is the source,

modifying the corresponding code of the source independently of  
the graphical representation in order to reflect a new link  
between the source and the other element and

modifying the graphical representation of the corresponding code of the  
source element to reflect the new link between the source element  
and the other element.

43. (cancelled).

44. (previously presented): The method of claim 184, further comprising the step of modifying the graphical representation of the code corresponding the source to reflect the removal of the link to the destination.

45. (original): The method of claim 42, further comprising the steps of:  
when it is determined that the selected element is the source,  
determining whether linking the source to the other element would violate  
a predefined rule; and  
when it is determined that linking the source to the other element would  
not violate a predefined rule,  
modifying the corresponding code of the source to reflect the  
removal of the link between the source and the destination;  
and  
adding new code to the corresponding code of the source to reflect  
the new link to the other element.

46. (cancelled).

47. (original): The method of claim 45, wherein the step of determining whether linking the source to the other element would violate a predefined rule, comprises the steps of:

determining whether the source is a class and whether the other element is another  
class; and

when it is determined that the source is the class and that the other element is the other class,

identifying the new link between the source and the other element as an inheritance link.

48. (original): The method of claim 45, wherein the step of determining whether linking the source to the other element would violate a predefined rule, comprises the steps of:

determining whether the source is a class and whether the other element is an interface; and

when it is determined that the source is the class and that the other element is the interface,

identifying the new link from the source to the other element as an implementation link.

49. (original): The method of claim 48, further comprising the step of identifying a link error when it is determined that the other element is not the interface.

50. (original): The method of claim 45, wherein the step of determining whether linking the source to the other element would violate a predefined rule, comprises the steps of:

determining whether the source is an interface and the other element is another interface; and

when it is determined that the source is the interface and the other element is the other interface,

identifying the new link between the source and the other element as an inheritance link.

51. (original): The method of claim 50, further comprising the step of identifying a link error when it is determined that the source is not the interface.

52. (original): The method of claim 50, further comprising the step of identifying a link error when it is determined that the other element is not the other interface.

53-67. (cancelled).

68. (currently amended): A method in a data processing system having a plurality of elements having a graphical representation, the method comprising the steps of:

displaying [[a]] the graphical representation of the corresponding code of each of the plurality of elements including a first and second element;

receiving an identification of a first of the plurality of elements;

receiving an identification of a second of the plurality of elements;

receiving an indication that the first element is to be included in the second element;

determining whether the inclusion of the first element in the second element would violate a predefined rule; and

when it is determined that the inclusion of the first element in the second element would not violate a predefined rule,

transferring the code corresponding to the first element into the second

element, wherein said code transfer occurs independently of the graphical representation and

modifying the graphical representation of the code of the second element to reflect the transfer of the code corresponding to the first element into the second element.

69-70. (cancelled).

71. (previously presented): The method of claim 68, wherein the step of transferring code comprises the steps of:

removing the code corresponding to the first element from a file;

placing the code corresponding to the first element within the code corresponding to the second element; and

deleting the file corresponding to the first element.

72. (previously presented) The method of claim 68, wherein the method further comprises the steps of:

when it is determined that the first element is the class and that the second element is not another class,

determining whether the second element is a package; and

when it is determined that the second element is a package,  
moving a file that includes code corresponding to the first element to a  
directory associated with the second element.

73-74. (cancelled).

75. (currently amended): A method in a data processing system having a plurality of elements, each element having corresponding code and a graphical representation, wherein code corresponding to a first of the plurality of elements is nested in the code corresponding to a second of the plurality of elements, the method comprising the steps of:

displaying [[a]] the graphical representation of the corresponding code of each of the plurality of elements including the first element and the second element;

receiving an indication that the first element is to be removed from the second element;

determining whether the removal of the first element from the second element would not violate a predefined rule; and

when it is determined that the removal of the first element from the second element would not violate a predefined rule,

removing code corresponding to the first element from the second

element, wherein said code removal occurs independently of the graphical representation and

modifying [[a]] the graphical representation of the code corresponding to the second element to reflect the removal of the first element from the second element.

76. The method of claim 75, further comprising the step of placing the code corresponding to the first element into a file.

77-78. (cancelled).

79. (previously presented): The method of claim 75, further comprising the steps of:

when it is determined that the first element is a class and that the second element is not another class,

determining whether the second element is a package; and

when it is determined that the second element is a package,

removing a first file that includes code corresponding to the first

element from a directory associated with the second element and

placing the first file in another directory.

80-82. (cancelled).

83. (currently amended): A computer-readable medium containing instructions for controlling a data processing system to perform a method, the data processing system

having a plurality of elements, each element having corresponding code and a graphical representation, the method comprising the steps of:

displaying [[a]] the graphical representation of the corresponding code of each of

the plurality of elements including the first element and the second element;

receiving a request to form a link;

receiving an indication of a first of the plurality of elements;

receiving an indication of a second of the plurality of elements; and

in response to receiving the request, the indication of the first element, and the indication of the second element,

generating new code independent of the graphical representation and

adding the new code to the first element to reflect the link to the second element and

modifying the graphical representation of the code associated with the first element to reflect the link to the second element.

84-85. (cancelled).

86. (original): The computer-readable medium of claim 83, wherein the step of adding new code to the first element comprises the steps of:

determining whether linking the first element to the second element would violate a predefined rule; and

when it is determined that linking the first element to the second element would

not violate a predefined rule,

adding the new code to the first element to form the link to the second element.

87. The computer-readable medium of claim 86, wherein the step of determining whether linking the first element to the second element would violate a predefined rule comprises the steps of:

determining whether the first element is a class and whether the second element is another class; and

when it is determined that the first element is the class and that the second element is the other class,

identifying the link from the first element to the second element as an inheritance link.

88. (original): The computer-readable medium of claim 87, wherein the method further comprises the step of identifying a link error when it is determined that the first element is the class and that the second element is not the other class.

89. (original): The computer-readable medium of claim 86, wherein the step of determining whether linking the first element to the second element would violate a predefined rule comprises the steps of:

determining whether the first element is a class and whether the second element is an interface; and

when it is determined that the first element is the class and that the second element is the interface,

identifying the link from the first element to the second element as an implementation link.

90. (original): The computer-readable medium of claim 89, wherein the method further comprises the step of identifying a link error when it is determined that the first element is the class and that the second element is not the interface.

91. (original): The computer-readable medium of claim 86, wherein the step of determining whether linking the first element to the second element would violate a predefined rule comprises the steps of:

determining whether the first element is an interface and the second element is another interface; and

when it is determined that the first element is the interface and the second element is the other interface,

identifying the link from the first element to the second element as an inheritance link.

92. (original): The computer-readable medium of claim 91, wherein the method further comprises the step of identifying a link error when it is determined that the first element is the interface and the second element is not the other interface.

93-101 . (cancelled).

102. (currently amended): A computer-readable medium containing instructions for controlling a data processing system to perform a method, the data processing system having a plurality of elements and having a link between two of the plurality of elements, wherein each element has corresponding code along with a graphical representation and the linked elements include a source and a destination, the method comprising the steps of:

displaying [[a]] the graphical representation of the corresponding code of each of the plurality of elements including the source and destination;  
receiving an identification of the link;  
receiving a selection of one of the linked elements;  
receiving an identification of another of the plurality of elements that is different than the linked elements, wherein a graphical representation of the corresponding code of the other element is displayed;  
determining whether the selected element is the destination; and  
when it is determined that the selected element is the destination,  
modifying the corresponding code of the other element independently of the graphical representation in order to reflect a new link between the other element and the destination element and  
modifying the graphical representation of the corresponding code of the other element to reflect the new link between the other element and the destination element.

103. (original): The computer-readable medium of claim 102, wherein the modifying step further includes the step of modifying the corresponding code of the source to reflect the removal of the link between the source and the destination.

104. (cancelled).

105. (previously presented): The computer-readable medium of claim 102, wherein the method further comprises the step of modifying the graphical representation of the corresponding code of the source to reflect the removal of the link between the source and the destination.

106-107. (cancelled).

108. (original): The computer-readable medium of claim 102, wherein the modifying step includes the steps of:

determining whether linking the other element to the destination would violate a predefined rule; and

when it is determined that linking the other element to the destination would not violate a predefined rule,

modifying the corresponding code of the source to reflect the removal of the link between the source and the destination; and

adding new code to the corresponding code of the other element to reflect

the new link between the other element and the destination element.

109. (original): The computer-readable medium of claim 108, wherein the step of determining whether linking the other element to the destination would violate a predefined rule, comprises the steps of:

determining whether the other element is a class and whether the destination is another class; and

when it is determined that the other element is the class and that the destination is the other class,

identifying the new link between the other element and the destination as an inheritance link.

110. (original): The computer-readable medium of claim 108, wherein the step of determining whether linking the other element to the destination would violate a predefined rule, comprises the steps of:

determining whether the other element is a class and whether the destination is an interface; and

when it is determined that the other element is the class and that the destination is the interface,

identifying the new link between the other element and the destination as an implementation link.

111. (original): The computer-readable medium of claim 110, wherein the method further comprises the step of identifying a link error when it is determined that the other element is the class and that the destination is not the interface.

112. (original): The computer-readable medium of claim 108, wherein the step of determining whether linking the other element to the destination would violate a predefined rule, comprises the steps of:

determining whether the other element is an interface and the destination is

another interface; and

when it is determined that the other element is the interface and the destination is  
the other interface,

identifying the new link between the other element and the destination as  
an inheritance link.

113. (original): The computer-readable medium of claim 112, wherein the method further comprises the step of identifying a link error when it is determined that the other element is not the interface.

114. (original): The computer-readable medium of claim 112, wherein the method further comprises the step of identifying a link error when it is determined that the destination is not the other interface.

115-123. (cancelled).

124. (currently amended): A computer-readable medium containing instructions for controlling a data processing system to perform a method, the data processing system having a plurality of elements and having a link between two of the plurality of elements, wherein each element has corresponding code along with a graphical representation and the linked elements include a source and a destination, the method comprising the steps of:

displaying [[a]] the graphical representation of the corresponding code of each of the plurality of elements including the source and destination;

receiving an identification of the link;

receiving a selection of one of the linked elements;

receiving an identification of another of the plurality of elements that is different than the linked elements, wherein a graphical representation of the corresponding code of the other element is displayed;

determining whether the selected element is the source; and

when it is determined that the selected element is the source,

modifying the corresponding code of the source independently of the graphical representation in order to reflect a new link between the source and the other element and

modifying the graphical representation of the corresponding code of the source to reflect the new link between the source and the other element.

125. (cancelled).

126. (previously presented): The computer-readable medium of claim 185, wherein the method further comprises the step of modifying the graphical representation of the code corresponding to the source to reflect the removal of the link to the destination.

127. (original): The computer-readable medium of claim 124, wherein the method further comprises the steps of:

when it is determined that the selected element is the source,

determining whether linking the source to the other element would violate

a predefined rule; and

when it is determined that linking the source to the other element would not violate a predefined rule,

modifying the corresponding code of the source to reflect the

removal of the link between the source and the destination;

and

adding new code to the corresponding code of the source to reflect the new link to the other element.

128. (cancelled).

129. (original): The computer-readable medium of claim 127, wherein the step of determining whether linking the source to the other element would violate a predefined rule, comprises the steps of:

determining whether the source is a class and whether the other element is another class; and

when it is determined that the source is the class and that the other element is the other class,

identifying the new link between the source and the other element as an inheritance link.

130. (original): The computer-readable medium of claim 127, wherein the step of determining whether linking the source to the other element would violate a predefined rule, comprises the steps of:

determining whether the source is a class and whether the other element is an interface; and

when it is determined that the source is the class and that the other element is the interface,

identifying the new link from the source to the other element as an implementation link.

131. (original): The computer-readable medium of claim 130, wherein the method further comprises the step of identifying a link error when it is determined that the other element is not the interface.

132. (original): The computer-readable medium of claim 127, wherein the step of determining whether linking the source to the other element would violate a predefined rule, comprises the steps of:

determining whether the source is an interface and the other element is another

interface; and

when it is determined that the source is the interface and the other element is the other interface,

identifying the new link between the source and the other element as an inheritance link.

133. (original): The computer-readable medium of claim 132, wherein the method further comprises the step of identifying a link error when it is determined that the source is not the interface.

134. (original): The computer-readable medium of claim 132, wherein the method further comprises the step of identifying a link error when it is determined that the other element is not the other interface.

135-149. (cancelled).

150. (currently amended): A computer-readable medium containing instructions for controlling a data processing system to perform a method, the data processing system

having a plurality of elements having a graphical representation, the method comprising the steps of:

displaying [[a]] the graphical representation of the corresponding code of each of the plurality of elements including a first and second element;  
receiving an identification of a first of the plurality of elements;  
receiving an identification of a second of the plurality of elements;  
receiving an indication that the first element is to be included in the second element;  
determining whether the inclusion of the first element in the second element would violate a predefined rule; and  
when it is determined that the inclusion of the first element in the second element would not violate a predefined rule,  
transferring the code corresponding to the first element into the second element, wherein the code transfer occurs independently of the graphical representation and  
modifying the graphical representation of the code of the second element to reflect the transfer of the code corresponding to the first element into the second element.

151-152. (cancelled).

153. (previously presented): The computer-readable medium of claim 150, wherein the step of transferring code comprises the steps of:

removing the code corresponding to the first element from a file corresponding to  
the second element;  
placing the code corresponding to the first element within the code corresponding  
to the second element; and  
deleting the file corresponding to the first element.

154. (original): The computer-readable medium of claim 150, wherein the method  
further comprises the steps of:

when it is determined that the first element is the class and that the second  
element is not the other class,  
determining whether the second element is a package; and  
when it is determined that the second element is a package,  
moving a file that includes code corresponding to the first element  
to a directory associated with the second element.

155-156. (cancelled).

157. (currently amended): A computer-readable medium containing instructions  
for controlling a data processing system to perform a method, the data processing system  
having a plurality of elements, each element having corresponding code and a graphical  
representation, wherein code corresponding to a first of the plurality of elements is nested  
in the code corresponding to a second of the plurality of elements, the method comprising  
the steps of:  
:

displaying [(a)] the graphical representation of the corresponding code of each of the plurality of elements including the first element and the second element;

receiving an indication that the first element is to be removed from the second element;

determining whether the removal of the first element from the second element would violate a predefined rule; and

when it is determined that the removal of the first element from the second element would not violate a predefined rule,

removing the code corresponding to the first element from the second element, wherein the code removal occurs independently of the graphical representation and

modifying a graphical representation of the code corresponding to the second element to reflect the removal of the first element from the second element.

158. (original): The computer-readable medium of claim 157, wherein the method further comprises the step of placing the code corresponding to the first element into a file.

159-160. (cancelled).

||

:

:

161. (previously presented): The computer-readable medium of claim 157, whereir. the method further comprises the steps of:

when it is determined that the first element is the class and that the second

element is not another class,

determining whether the second element is a package; and

when it is determined that the second element is a package,

removing a first file that includes code corresponding to the first

element from a directory associated with the second element and

placing the first file in another directory.

162-164. (cancelled).

165. (currently amended): A data processing system comprising:

a secondary storage device further comprising a plurality of elements, each

element having corresponding code and a graphical representation;

a memory device further comprising a program

that displays [[a]] the graphical representation of the corresponding code

of each of the plurality of elements including a first element and a

second element,

that receives a request to form a link,

that receives an indication of a first of the plurality of elements,

that receives an indication of a second of the plurality of elements,

that determines whether linking the first element to the second element

would violate a predefined rule,  
that generates new code independent of the graphical  
representation and adds the new code to the first element to reflect  
the link to the second element when it is determined that linking  
the first element to the second element would not violate a  
predefined rule, and  
that modifies the graphical representation of the code associated with  
the first element to reflect the link to the second element; and  
a processor for running the program.

166-167. (cancelled).

168. (original): The data processing system of claim 165, wherein when the program determines whether linking the first element to the second element would violate a predefined rule, the program determines whether the first element is a class and whether the second element is another class, and when it is determined that the first element is the class and that the second element is the other class, the program identifies the link from the first element to the second element as an inheritance link.

169. (original): The data processing system of claim 165, wherein when the program determines whether linking the first element to the second element would violate a predefined rule, the program determines whether the first element is a class and whether the second element is an interface, and when it is determined that the first element is the

class and that the second element is the interface, the program identifies the link from the first element to the second element as an implementation link.

170. (original): The data processing system of claim 165, wherein when the program determines whether linking the first element to second element would violate a predefined rule, the program determines whether the first element is an interface and the second element is another interface, and when it is determined that the first element is the interface and the second element is the other interface, the program identifies the link from the first element to the second element as an inheritance link.

171. (currently amended): A data processing system comprising:  
a secondary storage device further comprising a plurality of elements and having  
a link between two of the plurality of elements, wherein each element has  
corresponding code with a graphical representation and the linked  
elements include a source and a destination;  
a memory device further comprising a program  
that displays [(a)] the graphical representation of the corresponding code  
of each of the plurality of elements including the source and the  
destination,  
that receives a selection of one of the linked elements,  
that receives an identification of another of the plurality of elements that is  
different than the linked elements, wherein a graphical  
representation of the corresponding code of the other element is

displayed,

that determines whether the selected element is the destination, and

that when it is determined that the selected element is the destination,

generates new code independently of the graphical representation

and adds the new code to the code corresponding to the

other element to reflect the new link between the other

element and the destination when it is determined that the

selected element is the destination,

removes a portion of the corresponding code of the source that

reflects the link between the source and the destination,

modifies the graphical representation of the corresponding code of

the source to reflect the removal of the link to the destination, and

modifies the graphical representation of the corresponding code of

the other element to reflect the new link; and

a processor for running the program.

172. (original): The data processing system of claim 171, wherein when it is determined that the other element is the class and that the destination is not the other class, the program further determines whether the destination is an interface, and when it is determined that the destination is the interface, the program identifies the new link between the other element and the destination as an implementation link.

173. (original): The data processing system of claim 171, wherein when it is determined that the other element is not the class and that the destination is not the other class, the program further determines whether the other element is an interface and whether the destination is another interface, and when it is determined that the other element is the interface and that the destination is the other interface, the program identifies the new link between the other element and the destination as an inheritance link.

174-175. (cancelled).

176. (previously presented): The data processing system of claim 187, wherein when it is determined that the source is the class and that the other element is not the other class, the program further determines whether the other element is in an interface, and when it is determined that the other element is the interface, the program identifies the new link between the source and the other element as an implementation link.

177. (previously presented): The data processing system of claim 187, wherein when it is determined that the source is not the class and that the other element is not the other class, the program further determines whether the source is an interface and the other element is another interface, and when it is determined that the source is the interface and the other element is the other interface, the program identifies the new link between the source and the other element as an inheritance link.

178. (currently amended): A data processing system comprising:  
a secondary storage device further comprising a plurality of elements, each  
element having corresponding code and a graphical representation; a  
memory device further comprising a program that displays [[a]] the graphical  
representation of the code of a first of the plurality of elements and a graphical  
representation of the code of a second of the plurality of elements, that receives an  
indication that the first element is to be included in the second element, that  
determines whether inclusion of the first element in the second element would  
violate a predefined rule,

that transfers code corresponding to the first element into the second  
element when it is determined that the inclusion of the first element in the  
second element would not violate a predefined rule, wherein the code  
transfer occurs independently of the graphical representation, and  
that modifies a graphical representation of the code of the second element  
to reflect the transfer of the first element into the second element; and  
a processor for running the program.

179. (previously presented): The data processing system of claim 178, wherein  
the program removes the code corresponding to the first element from a file, places the  
code corresponding to the first element within the code corresponding to the second  
element, and deletes the file corresponding to the first element.

180. (currently amended): A data processing system comprising:

a secondary storage device further comprising a plurality of elements having graphical representations, wherein a first of the plurality of elements is nested within a second of the plurality of elements; a memory device further comprising a program that displays [[a]] the graphical representation of the code of a first of the plurality of elements and a graphical representation of the code of a second of the plurality of elements, that receives an indication that the first element is to be removed from the second element, that determines whether the removal of the first element from the second element would violate a predefined rule, and that removes the code corresponding to the first element from the second element when it is determined that the removal of the first element from the second element would not violate a predefined rule,

wherein the code removal occurs independently of each graphical representation,

that modifies the graphical representation of the second element to reflect the removal of the first element from the second element, and that places the code corresponding to the first element into a file; and a processor for running the program.

181. (cancelled).

182. (previously presented): The data processing system of claim 180, wherein the first element is a class and the second element is not another class, the program further determines whether the second element is a package, and when it is determined

that the second element is a package, the program removes the first file corresponding to the first element from a directory associated with the second element.

183. (currently amended): A system having a plurality of elements, each element having corresponding code and a graphical representation, the system comprising:

means for displaying [[a]] the graphical representation of the corresponding code of each of the plurality of elements;

means for receiving a request to form a link;

means for receiving an indication of a first of the plurality of elements;

means for receiving an indication of a second of the plurality of elements; and

means for generating new code independent of the graphical representation and adding the new code to the first element to reflect the link to the second

element in response to receiving the request, the indication of the first element, and the indication of the second element; and

means for modifying the graphical representation of the code associated with the first element to reflect the link to the second element.

184. (previously presented): The method of claim 42, further comprising the step of modifying the code corresponding to the source to reflect the removal of the link to the destination.

185. (previously presented): The computer-readable medium of claim 124, wherein the method further comprises the step of modifying the code corresponding to the source to reflect the removal of the link to the destination.

186. (previously presented): The data processing system of claim 171, wherein when it is determined that the other element is a class and that the destination is another class, the program identifies the new link between the other element and the destination as an inheritance link.

187. (currently amended): A data processing system comprising:  
a secondary storage device further comprising a plurality of elements and having  
a link between two of the plurality of elements, wherein each element has  
corresponding code and a graphical representation and the linked elements  
include a source and a destination;  
a memory device further comprising a program  
that displays [[a]] the graphical representation of the corresponding code  
of each of the plurality of elements including the source and the  
destination,  
that receives a selection of one of the linked elements,  
that receives an identification of another of the plurality of elements that is  
different than the linked elements, wherein a graphical  
representation of the corresponding code of the other element is  
displayed,

that determines whether the selected element is the source,  
that when the element is the source,  
removes a portion of the corresponding code of the source that  
reflects the link between the source and the destination,  
generates new code independently of the graphical representation  
and adds the new code to the code corresponding to the  
source to reflect the new link between the source and the  
other element,  
modifies the graphical representation of the corresponding code of  
the source to reflect the removal of the link to the  
destination, and  
modifies the graphical representation of the corresponding code of  
the source to reflect the new link to the other element; and  
a processor for running the program.

188. (previously presented): The data processing system of claim 187, wherein  
when it is determined that the source is a class and that the other element is another class,  
the program identifies the new link between the source and the other element as an  
inheritance link.

189. (previously presented): The data processing system of claim 180, wherein  
the method further comprises the step of placing the code corresponding to the first  
element into a file.

190. (currently amended) A system having a plurality of elements and having a link between two of the plurality of elements, wherein each element has corresponding code and a graphical representation and the linked elements include a source and a destination, the system comprising:

means for displaying [[a]] the graphical representation of the corresponding code of each of the plurality of elements including the source and the destination;

means for receiving an identification of the link;

means for receiving a selection of one of the linked elements;

means for receiving an identification of another of the plurality of elements that is different than the linked elements, wherein a graphical representation of the corresponding code of the other element is displayed;

means for determining whether the selected element is the destination; and

means for :

modifying the corresponding code of the other element to reflect a new link between the other element and the destination elements,

wherein the code modification occurs independently of the graphical representation, and

modifying the graphical representation of the corresponding code of the other element to reflect the new link between the other element and the destination element

when it is determined that the selected element is the destination.

I

191. (currently amended): A system having a plurality of elements and having a link between two of the plurality of elements, wherein each element has corresponding code having a graphical representation and the linked elements include a source and a destination, the system comprising:

means for displaying [[a]] the graphical representation of the corresponding code of each of the plurality of elements including the source and destination;

means for receiving an identification of the link;

means for receiving a selection of one of the linked elements;

means for receiving an identification of another of the plurality of elements that is different than the linked elements, wherein a graphical representation of the corresponding code of the other element is displayed;

means for:

modifying the corresponding code of the source to reflect a new link

between the source and the other element wherein the

corresponding code modification occurs independently of the  
graphical representation, and

modifying the graphical representation of the corresponding code of the source to reflect the new link between the source and the other element,

when it is determined that the selected element is the source.

192. (currently amended) A system having a plurality of elements, each having a graphical representation the system comprising:

means for displaying [[a]] the graphical representation of the corresponding code of each of the plurality of elements including a first and a second element;

means for receiving an identification of a first of a plurality of elements;

means for receiving an identification of a second of the plurality of elements;

means for receiving an indication that the first element is to be included in the second element;

means for transferring code corresponding to the first into the second element,  
wherein the code transfer occurs independently of the graphical representation; and

means for modifying the graphical representation of the code of the second element to reflect the transfer of the code corresponding to the first element into the second element.

193. (currently amended): A system having a plurality of elements, each element having corresponding code and a graphical representation, wherein code corresponding to a first of the plurality of elements is nested in code corresponding to a second of the plurality of elements, the system comprising:

means for displaying [[a]] the graphical representation of the corresponding code of each of the plurality of elements including the first element and the second element;

means for receiving an indication that the first element is removed from the

second element;

means for removing the code corresponding to the first element from the second element, wherein said code removal occurs independently of the graphical representation; and

means for modifying a graphical representation of the code corresponding to the second element to reflect the removal of the first element from the second element.

194. (previously presented): The data processing system in claim 165, further comprising a language-neutral representation of the source code, wherein the language neutral representation of the source code is used to generate a graphical representation of the source code and a textual representation of the source code.

195. (previously presented): The data processing system in claim 194, wherein modifications to the textual representation of the source code will immediately modify the corresponding graphical representation of the source code and vice versa, thereby allowing simultaneous viewing of the textual and graphical representations of the source code.

196. (previously presented): The data processing system in claim 194, wherein the language neutral representation of the source code is generated from a multiplicity of programming languages.

197. (previously presented): The data processing system in claim 165, wherein the source code is used directly to generate a graphical representation of the source code and a textual representation of the source code.

198. (previously presented): The data processing system in claim 171, further comprising a language-neutral representation of the source code, wherein the language neutral representation of the source code is used to generate a graphical representation of the source code and a textual representation of the source code.

199. (previously presented): The data processing in claim 197, wherein modifications to the textual representation of the source code will immediately modify the corresponding graphical representation of the source code and vice versa, thereby allowing simultaneous viewing of the textual and graphical representation of the source code.

200. (previously presented) The data processing system in claim 197, wherein the language neutral representation of the source code is generated from a multiplicity of programming languages.

201. (previously presented): The data proccsing system in claim 171, wherein the source code is used directly to generate a graphical representation of the source code and a textual representation of the source code.

202. (previously presented): The data processing system of claim 187, further comprising a language-neutral representation of the source code, wherein the language neutral representation of the source code is used to generate a graphical representation of the source code and a textual representation of the source code.

203. (previously presented): The data processing system in claim 202, wherein modifications to the textual representation of the source code will immediately modify the corresponding graphical representation of the source code and vice versa, thereby allowing simultaneous viewing of the textual and graphical representations of the source code.

204. (previously presented): The data processing system in claim 202, wherein the language neutral representation of the source code is generated from a multiplicity of programming languages.

205. (previously presented): The data processing in claim 187, wherein the source code is used directly to generate a graphical representation of the source code and a textual representation of the source code.

206. (previously presented): The data processing system in claim 178, further comprising a language-neutral representation of the source code, wherein the language neutral representation of the source code is used to generate a graphical representation of the source code and a textual representation of the source code.

207. (previously presented): The data processing system in claim 206, wherein modifications to the textual representation of the source code will immediately modify the corresponding graphical representation of the source code and vice versa, thereby allowing simultaneous viewing of the textual and graphical representations of the source code.

208. (previously presented): The data processing system in claim 206, wherein the language neutral representation of the source code is generated from a multiplicity of programming languages.

209. (previously presented): The data processing system in claim 178, wherein the source code is used directly to generate a graphical representation of the source code and a textual representation of the source code.

210. (previously presented): The data processing system of claim 180, further comprising a language-neutral representation of the source code, wherein the language neutral representation of the source code is used to generate a graphical representation of the source code and a textual representation of the source code.

211. (previously presented): The data processing system of claim 210, wherein modifications to the textual representation of the source code will immediately modify the corresponding graphical representation of the source code and vice versa, thereby

allowing simultaneous viewing of the textual and graphical representations of the source code.

212. (previously presented): The data processing system in claim 210, wherein the language neutral representation of the source code is generated from a multiplicity of programming languages.

213. (previously presented): The data processing system in claim 180, wherein the source code is used directly to generate a graphical representation of the source code and a textual representation of the source code.
